Education

Auburn University — Auburn, AL
Bachelor of Science in Software Engineering — *Expected May 2028*

Experience

Software Developer — Aug. 2026 – Present
RFID Lab — *Auburn, AL*

- Cut end-to-end load time from 11s to 5s on an internal Go and React dashboard serving 75K+ RFID test submissions by profiling the full request path and redesigning both the backend query layer and the frontend streaming layer
- Reduced backend response time from 8s to 3s by decomposing a seven-CTE MySQL query into eight concurrent queries with Go errgroup, joining results through in-memory hash maps so latency is bounded by the slowest query rather than their sum
- Replaced repeated array spreads in a React streaming hook with a single mutable buffer, turning $O(n^2)$ copying into amortized O(n) appends across ∼3,000 flushes per load

Software Engineering Intern — Sep. 2025 – Aug. 2026
OCV, LLC — *Opelika, AL*

- Diagnosed and resolved 100+ production defects – including crashes, configuration errors, and failed deployments – using Xcode and runtime log analysis, reducing average defect resolution time and unblocking releases for 300+ apps
- Owned release engineering for 300+ mobile applications on the Apple App Store and Google Play, shipping 50 releases per month and migrating 200+ apps into compliance with platform requirements

Software Engineering Intern — Jan. 2026 – May 2026
Room2Room Movers — *Auburn, AL*

- Built and deployed an automated lead-intake system that captured 200+ customer leads representing over $60K in estimated sales pipeline and routed qualified prospects directly to sales
- Shipped 12+ production features – including job scheduling and route tracking – using REST APIs, Firebase, and Azure Functions, enabling 30+ field operators to manage daily workflows efficiently
- Resolved state-management and data-sync defects affecting scheduling reliability, adding automated tests and using runtime debugging and log analysis to prevent regressions

Projects

Molar Money - codeLinc 11 Hackathon Winner | *React, TypeScript, FastAPI, Anthropic API, AWS EC2*

- Co-built on a five-person team a dental benefits copilot that estimates procedure costs and schedules treatment across plan years, with an AI assistant that pulls every dollar figure from a tested cost engine through tool calls
- Built the React and TypeScript frontend foundation – routing, theming, and landing page – and integrated Clerk authentication with per-person household profile selection
- Shipped the live demo by routing Netlify API traffic to the Dockerized FastAPI backend on AWS EC2

Auburn Course Finder & Auto-Register | *Python, React, Selenium, GitHub Actions, Docker, SQLite*

- Built a scraper and daily GitHub Actions pipeline that snapshots 7,300+ sections per term from Auburn's Banner class search, with retries and a size-regression guard that blocks partial overwrites
- Shipped a React search site on GitHub Pages with seat, time, and format filters and a watch list that feeds a Selenium tool that auto-registers the moment a seat opens, with email alerts and SQLite history

World Cup Match Predictor | *Python, PyTorch, XGBoost, FastAPI, AWS Lambda*

- Benchmarked XGBoost against a PyTorch network on 14 features from 32,000+ international matches under walk-forward evaluation, reaching 0.953 log loss and 54.5% accuracy (+7.3 points over baseline), served live via FastAPI on AWS Lambda

Technical Skills

Languages: Go, Python, Java, TypeScript, JavaScript, SQL, Bash
Frameworks/Libraries: React, React Native, Node.js, Express, FastAPI, PyTorch, Selenium, Tailwind CSS
Cloud/Databases: AWS Lambda, AWS EC2, API Gateway, Azure Functions, Firebase, PostgreSQL, MySQL
Developer Tools: Docker, Kubernetes, ArgoCD, Git, GitHub Actions, Jira, Xcode
